Introduction/ Problem Statement Data/ Methodology **Results:** Distribution by Qatar's Administrative Regions Distribution by Level of Education Labor Force Participation and Employment **Health Conditions**

Housing Conditions

Earnings for Qatari Women for All Marital Categories

Discussion/ Policy Implications

Qatar at present is witnessing rapid economic growth and this may mean that the traditional family values might be at stake due to increased socio-economic pressures and global interactions.

Data for the study were obtained from the Ministry of Development Planning and Statistics, Qatar Statistics Authority.

Qatar Population and Housing Census (2010) was used for analysis.

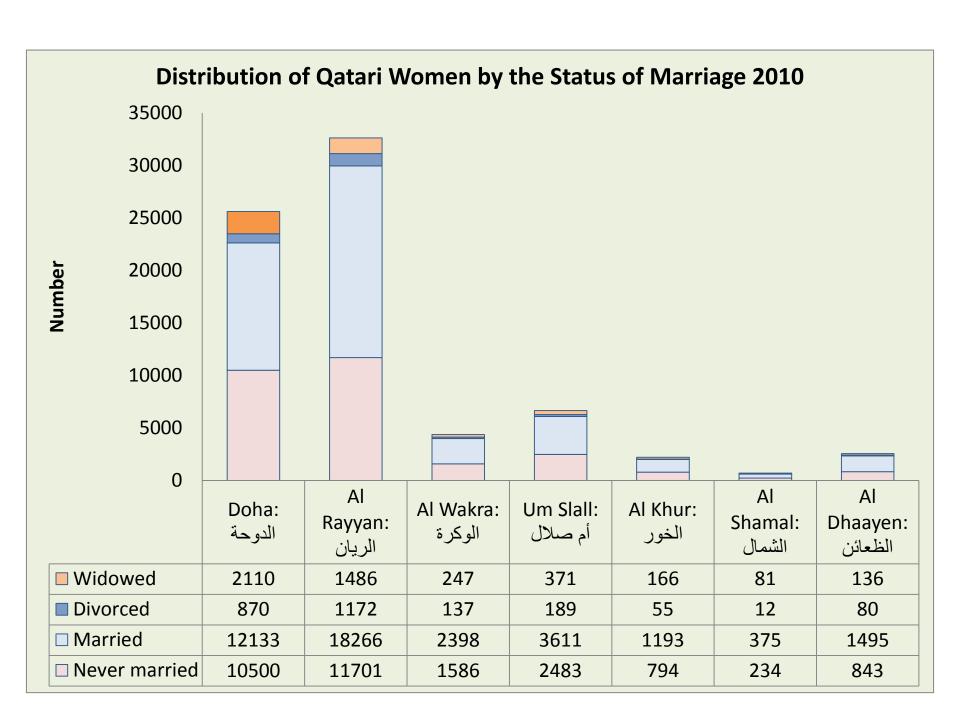

Census data was one of the most extensive nation-wide activity carried out in the State and reported data for 74,724 females across all administrative regions.

This study explored how Qatari women were distributed across marital status categories with respect to education, health conditions, housing and income. The prominence in frequency reflected on probable underlying association with the selected variables.

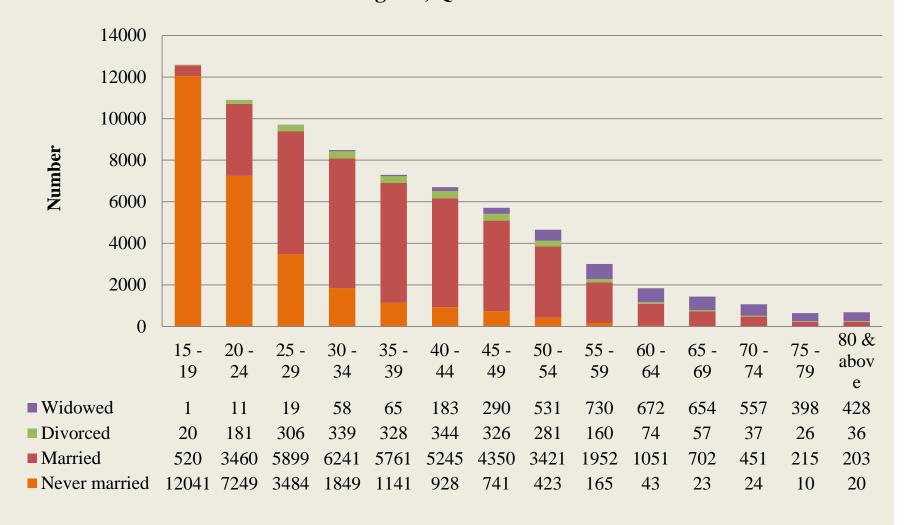

Quantitative analysis in terms of prominence in frequency was carried out to see how variations in selected indicators emerged across marital status categories and for different municipalities

Doha, AlRayyan, AlWakra, UmSlall, AlKhur, AlShamal, AlDhaayan

Status of Marriage and Nature of Main Occupation-National Data QSA 2010

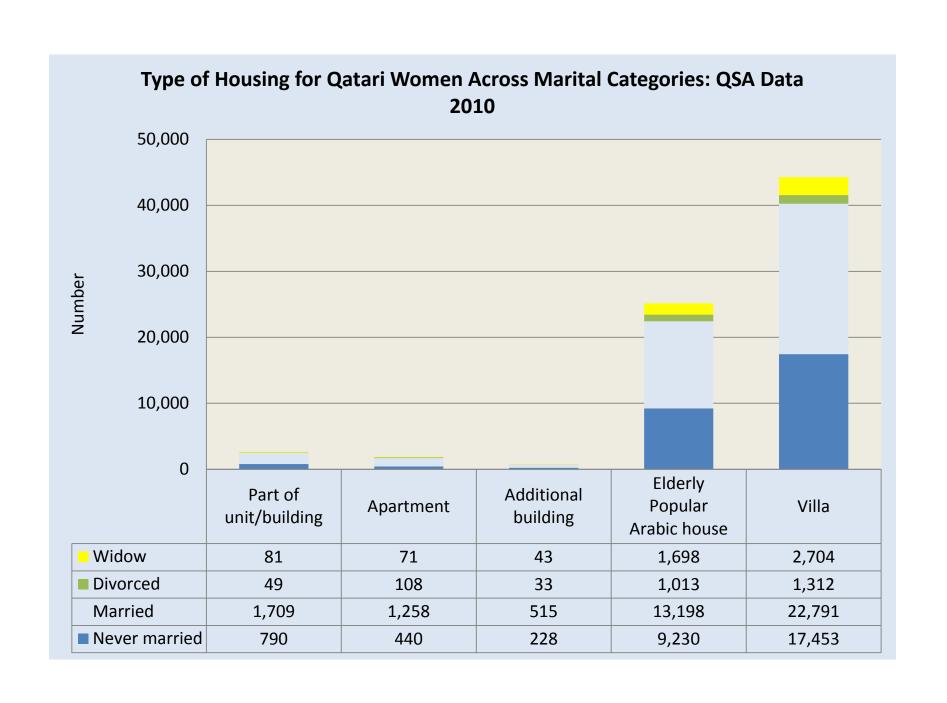

Marital Status of Qatari Women With or Without Disability: QSA Regional Data -2010

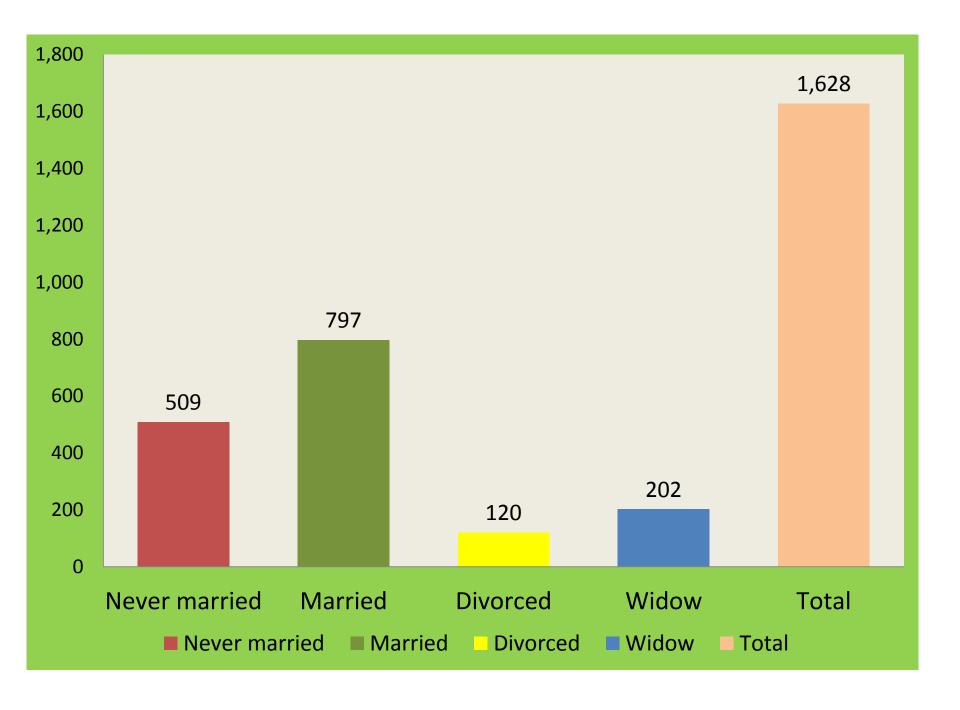

Discussion

Most Qatari women belonged to the married or never married categories.

Percentage of divorced and widowed was low.

Majority of the divorced were in the age categories of 25-50 years and widowed between 50-80 years.

Majority of the widowed were illiterate or could only read or write.

Majority of the divorced had secondary, post secondary or university education.

Majority of the never married were students and married/ widowed were home-makers.

Majority of the divorced were employed and worked in clerical, managerial or professional categories.

The majority of the divorced reported disability for seeing, walking, self-care and remembering.

The highest number of disabilities were reported in AlRayyan.

Across all marital categories, the least number of the divorced lived in villas, or Arabic popular housing, followed by the widowed.

The lowest monthly income was reported for the divorced followed by the widowed. Family policies need to focus on family integrity, and where marriages break or marital status changes because of death of the spouse, increased responsibility for social protection lies with the State.
